LEARNING MySQL QUERIES....
(Practical)

MySQL Functions

(Library Functions in MySQL)

- String
- Mathematical
- Date and Time

MySQL Functions

- A ***function*** is a special type of predefined command set that performs some operation and returns a single value. The input given to the functions are known as ***parameters or arguments.***

Categories of MySQL Function

i) **String Functions**

String functions are used to manipulate the text string in many ways.

ii) **Mathematical Functions / Numeric Functions**

The numeric functions are those functions that accept numeric values as input parameters (arguments) and returns numeric values after execution of the query

iii) **Date and Time Functions**

Date and Time functions operate on values of the DATE data type.

SUBSTR("string", starting Index number, number of characters to be extracted)
SUBSTRING("string", starting Index number, number of characters to be extracted)

NOTE: Index no. in MySQL for a string starts from 1. Any thing written inside ' ' or " " is the string. The output produced is the substring.

Index no.

Now() : Returns the time at which the function executes

Sysdate() : Returns the current date and time

```
mysql> select NOW();

DATE and TIME FUNCTIONS-

NOW( ) Vs SYSDATE( )

NOTE:

- **Sleep ( )** is a time delay function in seconds.
- **Now ( )** returns the same result even if used multiple time in the same query because it returns the begin –time of statement.
- **Sysdate ( )** returns the execution time i.e. at whattime it started to execute itself. Hence, the 2 secs sleep is considered in the 2nd query executed above

```
mysql> select NOW(), SLEEP(2),NOW();
+---------------------+----------+---------------------+
| NOW()               | SLEEP(2) | NOW()               |
